Fig. 4 UL131-128 mRNA processing – Panels (A-C) compare FIX-BAC DNA sequence (numbered according to Chee et al.) to a set of cDNA sequences from RACE clones 95-3, 95-8 and 95-11 (A) UL131 region, (B) UL128 region, (C) UL131-128 transcripts 3' end. Start codons, stop codons and the polyA site are in bold face, mRNA processing signals (splice donor sequence, splice acceptor sequence, AATAAA signal) are grey-shaded.

Figure 5

Fig. 5 Exon-intron organization of the FIX-BAC UL131-128 genetic locus. UL131 (green); UL130 (orange); UL128 (blue); UL128x1 C-terminus (light blue).

Figure 6

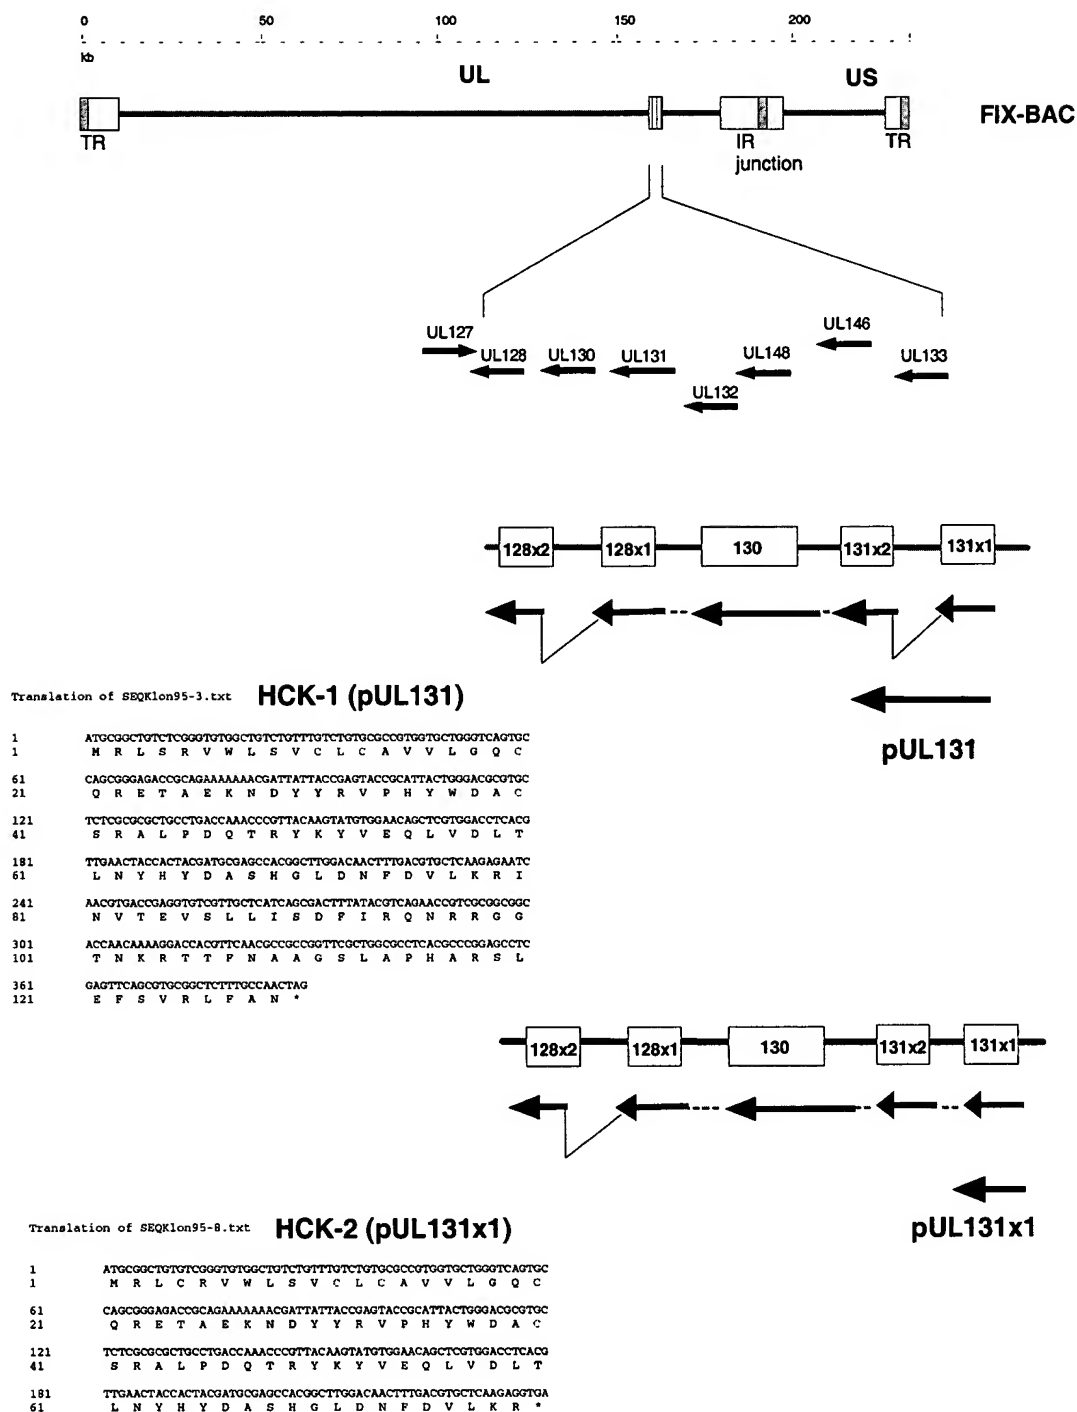

Fig. 6 Scheme of the differentially spliced transcripts of the UL131-128 region. Upper panel RACE clone 95-3 and predicted open reading frame (orf) pUL131 (HCK-1). Lower panel RACE clone 95-8 and predicted orf UL131x1 (HCK-2).

Figure 7

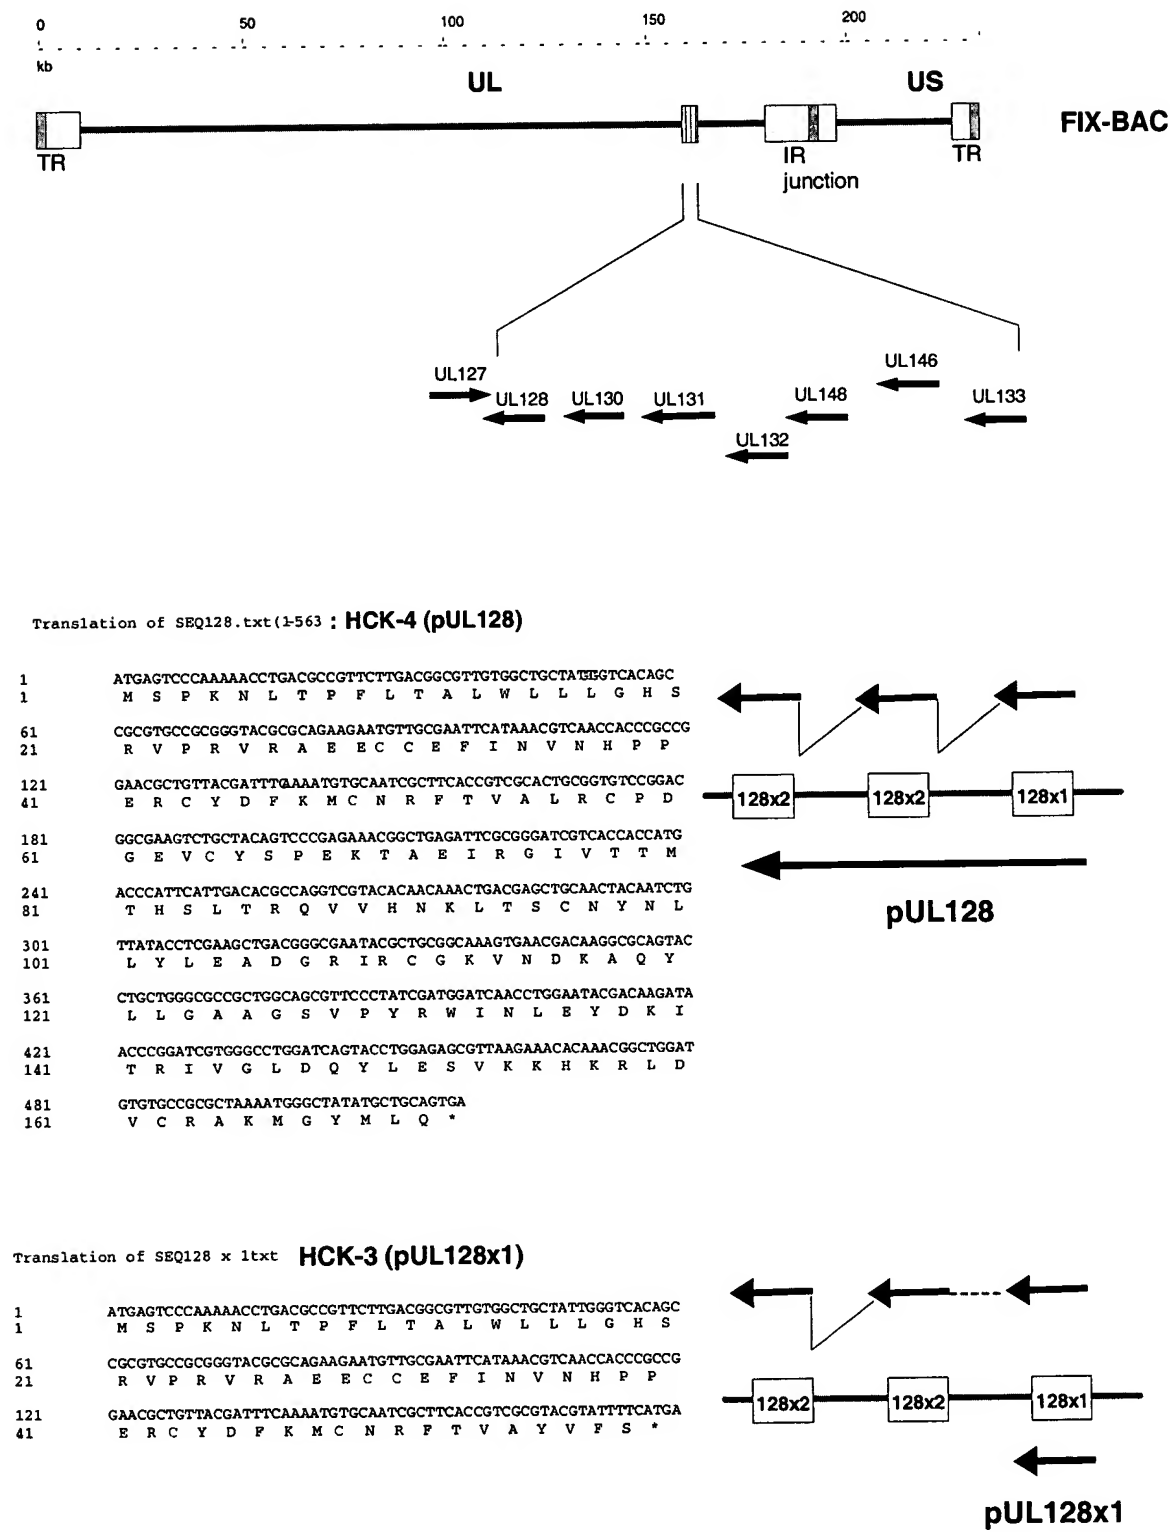

Fig. 7 Scheme of the differentially spliced transcripts of the UL131-128 region. Upper panel SEQUL128B and predicted open reading frame (orf) pUL128 (HCK-4). Lower panel SEQUL128A and predicted orf UL128x1 (HCK-3).

Figure 8

## Northern Blot Analysis

RVFIX, RVFIX mutants and laboratory strains:

Fig. 8 mRNA was prepared from RVFIX-infected fibroblasts 4 days p.i. using Rneasy Mini, QIAshredder and Oligotex mRNA Mini kits according to the manufacturer's guidance (Qiagen). For Northern blotting, 1  $\mu$ g RNA was electrophoresed on an agarose gel according to the MOPS-formaldehyde protocol and blotted onto Hybond N+ membranes (Amersham Pharmacia). Blots were hybridized with a UL131-128 specific probe.
